The research project "Testing of different strains of Friesian cattle" is aimed at comparing the genetic value for milk and meat production, as well as the efficiency of overall production, of Friesian progeny under the conditions obtaining in Polish owned commercial farms. The central part of the project was the matings in 1974-1976 and the results were published in 1982 (see Fig. 1). The project will be published in the participating countries are the project by each country so successive and cattle

countries also provide technical scientific advice and assistance for the Technical Advisory Comm established by FAO, which ordi nates the project activities in participating countries. This report covers the first five years (1974 to 1979) of the experimenta of the project. It gives a compri sive account of the experimental p dures, describes the current state of project and presents a preliminary tistical analysis of the growth rate milk production of the F. gener
